### Search Notes

Examiner Minnifield,

Here are the results for your recent search request.

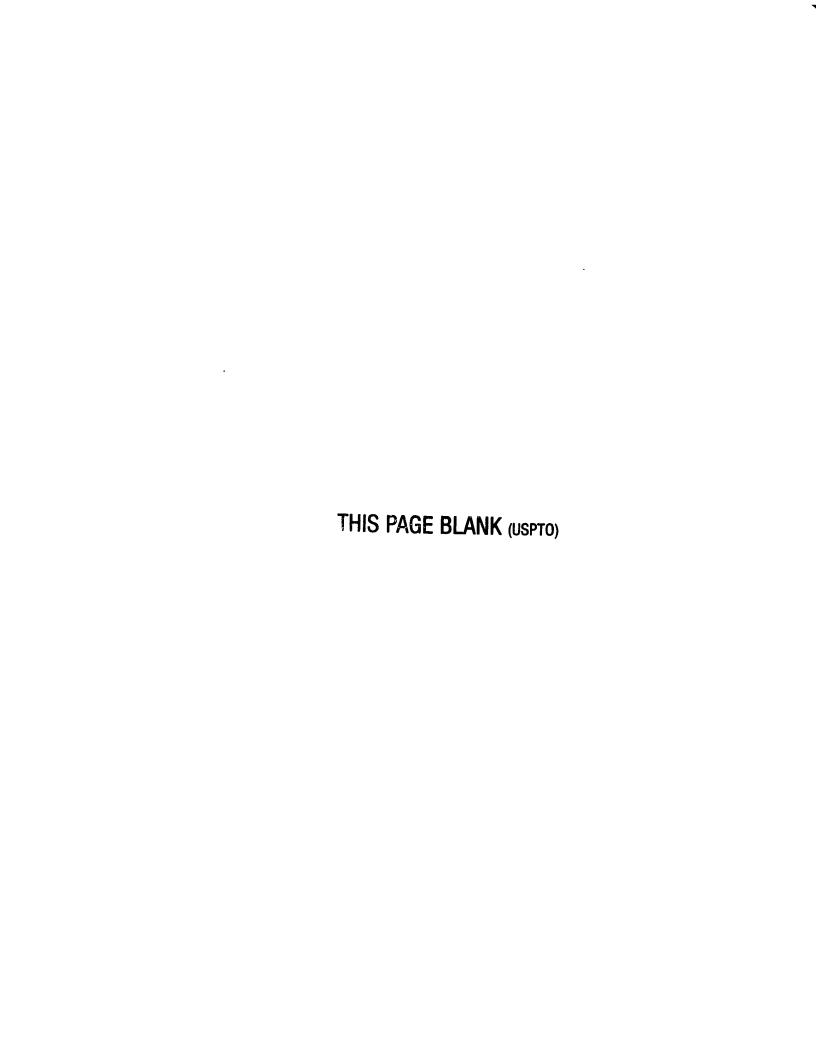

Please feel free to contact me if you have any questions about these results.

Thank you for using STIC services. We appreciate the opportunity to serve you.

Sincerely,

Mary Jane Ruhl Technical Information Specialist STIC Remsen 1-A-62 Ext. 22524

### STIC-Biotech/ChemLib

163642

From: Sent: Minnifield, Nita

Wednesday, August 24, 2005 12:36 PM

To: Subject: STIC-Biotech/ChemLib interference search request

10/789536

## STIC

Please do an interference sequence search on SEQ ID NO: 1 and 6 of this application.

Please show first 30 results/alignments.

Please provide a paper copy of all results.

Thanks, Minnifield, 71976 Art Unit 1645 Office REM-3C01 Mailbox REM-3C18 571-272-0860

AAV27641-751 represent immunostimulatory oligodecxyribonucleotides (ODNs) cof the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXICGX2N2 3', where at least one uncleotide separates consecutive CpGs, XI is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and NI+N2 is 0-26 bases with the provision that NI and N2 does not contain a CCGG tetramer CC or more than one CGG or CGG trimer OR 5' NIXICACGX3X4N 3', where at least cone nucleotide separates consecutive CpGs, XI and X2 are selected from GpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is any nucleotide and NI+N2 is 0.26 bases with the provision that NI and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The CODNs activate lymphocytes in a subject and redirect a subject's immune colons from a Th2 to a Th1 (e.g. by inducing monocytic cells and other CC cells to produce Th1 cytokines, including IL-12, IFN agamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic disorder, a dijuvant during antibody generation in a mammal such as a mouse or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New immunostimulatory nucleic acid molecules - which contain at least one unmethylated CpG dinucleotide, used for treating e.g. tumours, infections

This sequence represents a B cell stimulatory oligonucleotide. The invention relates to compositions comprising an oligonucleotide (I) with unmethylated guanine and cytosine nucleotides and an antigen in a carrier. The oligonucleotides can be administered to a subject in a carrier. The oligonucleotides are immunostimulatory cand can be used to treat, prevent or ameliorate an immune system can be used to treat, prevent or ameliorate an immune system deficiency e.g. cancer or a viral, fungal, bacterial or parasitic infection. They can also be administered as a vaccine adjuvant to stimulate the response of a host to a vaccine. The compositions can be used to treat humans or vertebrate animals including dogs, cate, sheep pigs, cows, goats, chickens, mice and monkeys. Preceding chemotherapy content animal should be useful for increasing the responsiveness of malignant cells to subsequent chemotherapy. The 8.40 nucleotide size of the oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunostimulatory oligonucleotides which enhance B cell activation useful for treating an immune system deficiency e.g. cancer.

```
The invention relates to treating a subject infected with HIV comprising administering a CpG nucleic acid (e.g. an adjuvant type CpG oligonucleotide, an immunostimulatory CpG oligonucleotide or a B cell stimulatory CpG oligonucleotide). The CpG are used as gene therapy vaccines to treat a subject infected with HIV. The present sequence is a B-cell stimulatory CpG oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating a subject infected with HIV by administering a CpG nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunostimulatory oligonucleotide; unmethylated CpG dinucleotide; immunoinhibitory oligonucleotide; cellular transcription factor; viral activity; lymphocyte activation; B cell; natural killer cell; NK; immune system deficiency; viral infection; immune disease; SLE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to immunomodulatory oligodecxyribonucleotides (ODNs) containing methylated or unmethylated cytosine-guanine (CpG) dinucleotides. Immunostimulatory ODN compositions having unmethylated CpG dinucleotides are useful for activating lymphocytes and for treating, preventing or ameliorating an immune system deficiency e.g. tumour or cancer or viral, fungal, bacterial or parasitic infection and leukaemia. Neural ODN that contains a methylated CpG dinucleotide are useful for treating diseases such as systemic lupus erythematosus, sepsis and autoimmune diseases. Immunoinhibitory ODN containing CpG dinucleotides that are not in the stimulatory motif and GCG trinucleotide sequences at or near both termini have antiviral activity. The present sequence is an immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunostimulatory composition useful for stimulating immune response in a subject, comprises antigen and immunostimulatory nucleic acid comprising oligonucleotides having unmethylated cytosine-guanine dinucleotides.

The present invention relates to immunostimulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, and financianibitory oligonucleotides which are capable of interfering with the activity of viral or cellular transcription factors. The immunostimilatory oligonucleotides are useful for activating a subject's lymphocytes (B cells or natural killer (NK) cells). They are useful for treating a subject or reating, preventing or ameliorating an immune system deficiency. The immunoinhibitory oligonucleotides are useful for treating or preventing or a subject. They are also useful for treating or preventing or preventing an immune system deficiency in a subject. The immunoinhibitory oligonucleotides can be used in a pharmaceutical composition which may be used for vaccinating a subject. The composition which may be used for treating an immune disease such as systemic lupus exthematosus (SLB), sepsis, or cancer. The conjouncleotides are safe to use since they do not initiate an immune constitution of the configuration of the conf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reaction when administered to a subject in vivo. ACA62324-ACA62352 represent the immunomodulatory oligonucleotides of the invention. Note: The present sequence given as SEQ ID No:1 in the Sequence listing differs from that given on page 6 (ACA62351) and page 17 (ACA62352) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lymphocyte; B cell; natural killer cell; immune response; systemic lupus erythematosus; sepsis; viral infection; immunosuppressive; immunostimulating; antibacterial; antiinflammatory; dermatoological; virucide; phosphorothioate backbone; se.
                                                                                                                                                                                                           Novel immunostimulatory oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide, useful for activating a subject's B cells or natural killer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                           The present invention provides oligonucleotides comprising unmethylated CpG dinucleotides. The invention is useful to activate lymphocytes specifically to activate B calls and natural killer cells, for treating diseases associated with an immune system activation such as systemic lupus erythematosus, sepsis and viral infections. The invention is useful as an immunosuppressive, immunostimulating, immunomodulating, antibacterial, antiinflammatory, dermatological and virucidal agent. The present sequence is a mitogenic oligonucleotide used in the stimulation of B-cells. This sequence is used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    B-cell stimulation; CpG island; ss; viral transcription factor; cellular transcription factor; immunoinhibitor; immune system deficiency; systemic lupus erythematosus; sepsis; tumour; cancer; viral infection; fungal infection; bacterial infection; parasitic infection; vaccine;
                                                                                                                                                                                                                                                                         New immunomodulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, useful for treating diseases including

```
The invention relates to a new oligonucleotide which: (a) comprises about

2-100 nucleotides and containing at least one unmethylated CpG

dinucleotide; or (b) is capable of interfering with the activity of viral

or cellular transcription factors and containing a consensus

immunolabilitor CpG motif represented by the formula (I): 5'GCGXnGCG3'

where X a nucleotide and n 0-50. Also included are an oligonucleotide

delivery complex (comprising the oligonucleotide, and a targeting means),

a pharmaceutical composition comprising the oligonucleotide and a

pharmaceutical carrier, activating a subject's B cells or natural killer

cells (by contacting the cells with the oligonucleotide and a

vaccinating a subject by administering the composition in conjunction

with a vaccine, treating a disease associated with an immune system

activation in a subject (by administering neutral oligonucleotide alone

cor in conjunction with a pharmaceutical carrier), an improved

method for in vivo diagnoses using oligonucleotide probes comprising

coligonucleotides prior to administration to a subject by

subject and treating or preventing or preventing or ameliorating an

cuthout the immunoinhibitory oligonucleotide defined above. The

colligonucleotide is useful for treating, preventing or ameliorating an

constitution in the immunoinhibitory oligonucleotide defined above. The

colligonucleotide is useful for treating, preventing or ameliorating an

constitution of the immunoinhibitory oligonucleotide privaticing in a

continue system deficiency, such as systemic lupus erythematosus, sepsis,

containing antial, the oligonucleotide privaticing in a

containing antial, the oligonucleotide and a pravating or

containing antial, the oligonucleotide and treating and a preventing or parasitic infection in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               subject's B calls or natural Killer cells, for treating, preventing or ameliorating an immune system deficiency or for vaccinating a subject. The immunoinhibitory oligonucleotide is useful for treating or preventing a viral infection in a subject. The oligonucleotides may also be used in conjunction with a vaccine to boost a subject's immune system to effect a better response from the vaccine, or for increasing the responsiveness of the malignant cells to subsequent chemotherapy. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides containing unmethylated CpG dinucleotide, useful for

```
The invention relates to oligonucleotides containing at least one cummethylated CpG dinucleotide. The invention relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targeting means, a method of activating a subject's B cells or natural killer cells by contacting the cells with an coligonucleotide, a method of treating, preventing or ameliorating an aubject by administering the composition in conjunction with a vaccine, a method of treating a disease associated with an immune system activation in a subject by administering a neutral oligonucleotide alone or in conjunction with a pharmaceutical carrier, and a method of performing conjunction with a pharmaceutical carrier, and a method of performing cantisense therapy comprising methylating CpG containing oligonucleotides or treating diseases associated with immune system activation, such as prior to administration to a subject. The oligonucleotides are useful for treating diseases associated with immune system activating a subject's B cells or natural killer cells, for treating, preventing a subject's C an immune system deficiency or for vaccinating a subject. The remaining or preventing a immunoinhibitory oligonucleotides are useful for treating or preventing a viral infection in a subject. The oligonucleotides may also be used in conjunction with a vaccine to boost a subject is mmune the remanned from the remanned

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for stimulating an immune response or for treating diseases associated with immune system activation, e.g. systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotides capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG motif having the formula: 5'GCGMGCG3', where X is a mucleotide and n is 0-50 and a phosphorothioate backbone modification. The invention also describes an oligonucleotide delivery complex comprising the oligonucleotide and a targeting means e.g. a pharmaceutical carrier. The oligonucleotide and a targeting means e.g. a pharmaceutical carrier. The oligonucleotides are used for activating a subject's B cells or natural killer cells; treating, preventing or ameliorating an immune system deficiency in a subject; treating a disease associated with an immune system activation in a subject (systemic lupus erythematosus or sepsis); performing antisense therapy comprising methylating CpG
                                                                                                                                                                                                                                                                        phosphorothioate backbone; B cell activation; anatural Killer cell activation; immune system deficiency; systemic lupus erythematosus; antisense; methylation; antiinflammatory; dermatological; immunosuppressive; virucide; ss;
                                                                                                                                                                                                                                                         cellular transcription factor; immunoinhibitory; CpG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "phosphorothioate linkage"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "phosphorothioate linkage"

ö
containing oligonucleotides prior to administration to a subject; an improved method for in vivo diagnoses using oligonucleotide probes comprising methylaring CPG containing oligonucleotides prior to administration to a subject; and treating or preventing a viral infection in a subject. The targeting means is selected from cholesterol, virosome, liposome, lipid, or a target cell specific binding agent. The oligonucleotides described in the invention have antiinflammatory, dermatological, immunosuppressive and virucide activity. ADR20014-ADR20040 represent the oligonucleotides describes in the disclosure of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligonucleotide comprises at least one unmethylated CpG dinucleotide,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                            The invention relates to an oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide. The coligonucleotide is capable of interfering with the activity of viral or cellular transcription factors and containing a consensus colligonucleotide and niso-50. Also included are an oligonucleotide delivery complex (comprising the oligonucleotide above and a targeting means), a complex (comprising the oligonucleotide above and a targeting means), a pharmaceutical carrier), activating a subject's B cells, activating a cubject's complex (comprising the oligonucleotide above and a performance associated with an immune system activation in a subject, treating of gesage associated with an immune system activation in a subject, treating or oligonucleotides prior to administration to a subject in vivo diagnoses oligonucleotides prior to administration to a subject and treating or preventing a viral infection in a subject. The oligonucleotide is associated with immune system activation including or treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis, or for treating, preventing, or treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis, or for treating or preventing, or cligonucleotide is also useful for treating or preventing or immune system deficiency in a subject. The cligonucleotide is also useful for treating or preventing, or immune system deficiency in a subject of the invention. It is also useful for treating or preventing or immune system climent in the present sequence is an immune for immune system climent in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention provides oligonucleotides comprising immunomodulatory unmethylated CpG dinucleotide. The invention is useful for treating, preventing and ameliorating immune system deficiencies such as systemic lupus erythematosus and sepsis, tumour, cancer, viral, bacterial and fungal infections. The invention acts as an cytostatic, virucidal, antibacterial, fungicidal, antibinflammatory, dematological and immunosuppressive agent. The invention is also useful in the production of vaccines and in gene therapy. The present sequence is a mitogenic CpG oligonucleotide used in B-cell activation. Note: This sequence is stated to be SEQ ID No: 1 in the sequence listing. However, this sequence differs from the sequence designated as SEQ ID No: 1 in the
                                                                                                                                                                                                                                                                                                             New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immune response; immune system deficiency; tumour; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides novel oligonucleotides containing unmethylated CpG dinucleotides and therapeutic utilities based on their ability to estimulate an immune response in a subject. Oligonucleotides of the invention are useful for treating, preventing or ameliorating an immune system deficiency or a tumour, cancer, viral, bacterial or fungal infection. They are useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis. They are also useful as vaccines to boost subject's immune system. The invention is also useful in gene therapy. The present sequence is a CpG oligonucleotide used to stimulate B-cells. Note: This sequence is stated to be the same as that shown as SEQ ID NO: 1 in page 18 of the specification. However these sequences differ.
                                                                                                                                                                                                                                                                                                          New oligonucleotide comprises at least one unmethylated CpG dinucleotide,
                                                                                                                                                                                                                                                                                                                         useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CpG dinucleotide, gene therapy a, vaccine, cancer; viral infection, fungal infection, bacterial infection, parasitic infection, systemic lupus erythematosus; sepsis; ss.

New immunomodulatory oligonucleotides for preventing, treating or ameliorating diseases associated with immune system deficiency or activation, e.g. cancer, viral infection, systemic lupus erythematosus or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an oligonucleotide containing at least one unmethylated CpG dinucleotide. The invention is useful in gene therapy and for preparing vaccine. The invention is also useful for preventing, treating or ameliorating diseases associated with immune system deficiency or activation such as cancer, viral, fungal, bacterial or parasitic infection, systemic lupus erythematosus or sepsis. The present sequence is a CpG immunomodulatory oligonucleotide used in B cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunomodulator; immune system; systemic lupus erythematosus; sepsis; viral infection; vaccine; B cell; virucide; phosphorothioate backbone;

containing at least one unmethylated CDG dinucleotide, and immunoinhibitory oligonucleotides which are capable of interfering with the activity of viral or cellular transcription factors. The activity of viral or cellular transcription factors. The cimmunostimluatory oligonucleotides are useful for activating a subject's immunostimluatory oligonucleotides are useful for activating a subject or treating, preventing or ameliorating an immune system deficiency. The immunoinhibitory oligonucleotides are useful for treating or preventing or useliorating an immune system deficiency. The cimmunoinhibitory oligonucleotides are useful for treating or preventing or preventing or ameliorating an immune system deficiency. The cimmunoinhibitory oligonucleotides can be used in a pharmaceutical composition which may be used for vaccinating a subject. The systemic lupus erythematosus (SLB), sepais, or cancer. The oligonucleotides may be used for treating on immune disease such as systemic lupus erythematosus (SLB), sepais, or cancer. The craction when administered to a subject in vivo. ACASC3224-ACASC322.

Treation when administered to a subject in vivo. ACASC3324-ACASC322.

The present the immunomodulatory oligonucleotides of the invention. Note: The present sequence given as SEQ ID No:1 on page 17 (ACASC3322) of the conciliants.
                                                                                                                                                                                                                                                                                                                                                                                                                Novel immunostimulatory oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide, useful for activating a subject's B cells or natural killer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunomodulatory oligonucleotide contg. unmethylated C-G dinucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to immunomodulatory oligonucleotides containing an unmethylated CpG dinucleotide. The oligonucleotide of the invention is useful in preparing a composition for treating a disease associated with an immune system activation, e.g. systemic lupus erythematosus, sepsis or viral infection. It is also useful to prepare vaccine. The present sequence is an immunomodulatory oligonucleotide used to stimulate B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunostimulatory oligonucleotide; unmethylated CpG dinucleotide; immunoinhibitory oligonucleotide; cellular transcription factor; viral activity; lymphocyte activation; B cell; natural killer cell; NK; immune system deficiency; viral infection; immune disease; SLE; systemic lupus erythematosus; sepsis; cancer; immunomodulatory; immunostimulant; dermatological; antiinflammatory; cytostatic; antibacterial; virucide; phosphorothioate; ss.

THE LILLIE HAX SX CAME AND CONTROL OF THE CONTROL O

```
This sequence represents an unmethylated CpG dinucleotide, and can be used in the method of the invention. The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one unmethylated CpG. The nucleic acids containing an unmethylated CpG dinucleotide affect an immune response in a subject by activating natural killer cells (NK) or redirecting a subject's immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. They can be used to treat pulmonary disorders having an immunologic component, such as asthma or environmentally induced airway disease. They can also be used to treat diseases associated with Grampositive bacterial infections or endotoxaemia including bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunostimulatory nucleic acid molecules - which contain at least one unmethylated CpG dinucleotide, used for treating e.g. tumours, infections or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV27641-751 represent immunostimulatory oligodeoxyribonucleotides (ODNs) of the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXICGXZNZ 3', where at least one nucleotide separates consecutive (CpGs, XI is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and N1+NZ is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer
                                                                                                                                                                                                                                       meningitis, neonatal sepsis, cystic fibrosis, inflammaTory bowel disease and liver cirrhosis, Gram-negative pneumonia, Gram-negative abdominal abscess, haemorrhagic shock, disseminated intravascular coagulation, or an inflammatory response to lipopolysaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunostimulatory; oligodeoxyribonucleotide; ODN; unmethylated Cpg dinucleotide; activate; lymphocyte; immune response; 17h2; Th1; cytokine; treatment; prevention; asthma; autoimmune disease; desensitisation therapy; artificial adjuvant; antibody generation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunostimulatory oligodeoxyribonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                               AAT16894-T16898 are immunomodulatory oligonucleotides contg. at least one unmethylated C-G dinucleotide. The oligonucleotides can be used to activate B cells and natural killer cells. They can be used for treating, preventing or ameliorating an immune system deficiency, e.g. a tumour, cancer or a viral, fungal, bacterial or parasitic infection. They are also useful in stimulating a subject's response to a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Unmethylated CpG dinucleotide; immune response; bacterial meningitis; natural killer cell activation; NK cell; Th2 response; neonatal sepsis; pulmonary disorder; asthma; environmentally induced airway disease; bacterial infection; endotoxaemia; therapy; cystic fibrosis;

The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inscring a stimulatory CpG (CpG-N) motifs and optionally inscring a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from
or more than one CCG or CGG trimer OR 5' NXIX2CGX3X4N 3', where at least one nucleotide separates consecutive CpGs, X1 and X2 are selected from GpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The ODNs activate lymphocytes in a subject and redirect a subject's immune response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other cells to produce Th1 cytokines, including IL-12, IFN-gamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic disorder, autoimmune diseases, in desensitisation therapy, as an artificial adjuvant during antibody generation in a mammal such as a mouse or a

The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficiacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptocic proteins, interferons, hormones, clotting factors, ligands and receptors. (Updated on 20-MAR-2003 to correct PA field.)
hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic obyoperide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormones, clotting factors, ligands and receptors. (Updated on 20-MAR-2003 to correct PA field.)

The invention relates to a microdroplet emulsion (microemulsion) with an adsorbent surface, and which comprises a metabolisable oil and an emotorbalitying agent (a detergent). It also relates to a composition comprising the microemulsion and a microparticle with an adsorbent surface, where the microparticle comprises a polymer selected from a polytothoester, a polyanhydride, and a polytyanoacrylate, and a second detergent. The surface of the microparticles efficiently adsorb biologically active macromolecules such as DNA, polypeptides, antigens, hormones, pharmaceutericals, enzymes, mediators of transcription or translation, metabolic intermediates and adjuvants. Additionally, a second biologically active molecule may be encapsulated within the microemulsion can be used in methods of immunising a host animal, particularly a human, against a viral, bacterial or the microemulsions the appropriate antigens adsorbed) may be particularly used as vaccines for hepartiss C virus (HRV), hepatitis B virus (HBV), herpes simplex virus (HSV), human immunodeficiency virus (HIV), cytomegalovirus (CMV), influenza virus, and rabies virus; the

Natural Killer and T cells are activated by exposure to oligonuclectides containing CpG motifs. Oligonuclectides containing CpG motifs can be used as adjuvants in vaccines. The present invention relates to a CpG receptor contains a Toll homology domain (THD). The Toll receptor family are associated with responses to pathogens. CpG oligonuclectides may act as simulators of various immune responses. The CpG receptor or cells expressing the receptor are useful for identifying a compound which binds to or modulates an activity of the CpG receptor. The compounds are useful in e.g. vaccine adjuvants promoting cellmediated immune responses, antibacterials, (e.g. protection from Listeria
bacteria which cause cholera, diphtheria, tetanus and pertussis; lelicobacter pylori and Haemophilus influenzae; and malaria-causing parasites. Sequences AAA90447.490467 represent Thi lymphocyte stimulating oligonucleotides containing at least one CpG motif which are claimed for

The present invention describes methods for inducing interleukin 6 (IL-6), interferon-gamma (IFN-gamma) or IL-12, or for stimulating natural killer cell 1ytic activity. The methods comprise administering to the subject or exposing a natural killer cell to an immunostimulatory nucleic acid. Also described are: (1) inducing IL-6 in a subject comprising administering to the subject to induce IL-6 in the subject the immunostimulatory nucleic acid to stimulating natural killer cell lytic activity comprising exposing a natural killer cell to the immunostimulatory nucleic acid to stimulate natural killer cell lytic activity; (3) inducing interferon-gamma in a subject to treat an immune system deficiency comprising administering to the subject to induce interferon-gamma production, the immunostimulatory nucleic acid; and (4) inducing IL-12 in a subject comprising administering to the subject to induce immunostimulatory nucleic acid. The methods are useful for inducing IL-6,
infection), tumour immunotherapy, allergy treatment, (e.g. suppressing IgE in human PBMC, shifting from Th2 to Th1) and as anti-inflammatory agents (e.g. for use in cystic fibrosis, sepsis, heart disease, chlamydis, inflammatory bowel disease, arthritis and multiple sclerosis). The present sequence represents a CpG motif containing oligonucleotide used in examples demonstrating that CpG oligonucleotides can activate the

The present invention relates to a composition comprising an isolated immunostimulatory nucleic acid which comprises unmethylated cytosine-guanine (CpG) dinucleotides and an antigen in a carrier. The present sequence is an oligonucleotide, which was used in the present invention. The immunostimulatory nucleic acids are useful for ameliorating an immune system deficiency (the presence of tumour, cancer or infectious agent) in a subject. The immunostimulatory nucleic acids are also useful for eseponse to contact with a particular allergen. The immunostimulatory nucleic acids are also useful for vaccination and for treating law and in a subject on administration prior to or in conjunction with a chemotherapy, so that the subject or la conjunction with a chemotherapy, rhe compositions are useful for inducing an antigen consectivity in the subject or the compositions are useful for inducing an antigen appecific immune response in the subject. The compositions can be also used to treat or prevent the symptoms of asthma
                                                                                                                                                                        ö
interferon-gamma or IL-12, or stimulating natural killer cell lytic activity in a subject, particularly a human. The methods are particularly useful for modulating an immune response. AAH50571 to AAH50671 represent oligonucleotide sequences used in the exemplification of the present

The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administrating annihistering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothicate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is
                                                                Immunostimulatory nucleic acid; ISNA; human; interferon alpha; IFN-alpha; viral infection; phosphorothioate backbone; palindrome; cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CpG oligodeoxynucleotide; unmethylated; antigen-presenting cell; immunogenic; cytokine release; natural killer cell; NK cell activation; cell-mediated immune response; T-cell response; humoral response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Improving the efficacy of treatments involving the administration of interferon-alpha by co-administering an isolated immunostimulatory nucleic acid.
                                 Human IFN-alpha immunostimulatory nucleic acid SEQ ID NO: 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acid are also provided. These may comprise oligonucleotides with phosphorothioate backbones, palindromes, or Grich sequences. The equences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide

The invention relates to novel immunogenic CpG oligodeoxynucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5.*NNNT-CpG-WNNN-3' or 5.*RX-CpG-RY -3'. The central CpG motif is unmethylated, and the oligonucleotides coptionally have phosphorothioate linkages which make them more resistant corporatedation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide of elivery complex. The oligonucleotides are able to induce elither a cell-mediated (T-cell) response or a humoral (B-cell, antibody) response, with colliquated fresponse, and those of the sequence 5'.NNT-CpG-WNNN-3' cell-mediated response, and those of the sequence 5'.NNT-CpG-WNNN-3' cell-mediated response, and dendritic cells), which then release cytokines, cell-mediated cation, the oligonucleotide acts on antigen-presenting cells (e.g., macrophages and dendritic cells), which then release cytokines, leading to activation of natural killer (RK) cells. A cell-mediated or humoral response can then occur by activation of T- or B-cells. The induction of an immunogenic CpG oligonucleotide is administered either alone or ameniorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonucleotide is administered either alone or in combination with an anti-allergenic agent or anti-infectious agent. The allergic conditions which may be treated include eczema, allergic conditions, and the infections which may be treated include eczema, allergic conditions, and the infections which may be treated include eczema, allergic conditions, and the infections which may be treated include eczema, allergic conditions, and the infections which may be treated include eczema, allergic conditions, and the infections which may be tr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exposure to an agent of biological warfare. An immunogenic Cpd oligonucleotide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonucleotide is preferably administered to

With the exception of oligonuclectide WD1005 (AAF59505), the immunostimulatory oligonuclectides contain at least one unmethylated CpG motif. In preferred embodiments the internuclectide linkage is phosphorodithioate, although phosphodisster and other internuclectide bonds, or mixtures of linkages are within the scope of the invention. The HIV antigen may be selected from gp160, gp120, Nef, Tat, and Nef or Tat derivatives or Husion proteins. The vaccine is used for the prophylaxis or treatment of HIV infection in a patient. The present sequence represents a specifically claimed immunostimulatory CpG oligonuclectide for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New vaccine formulation comprising human immunodeficiency virus (HIV) antigen and immunostimulatory CpG oligonucleotide, useful for preventing and treating HIV infections in a patient.
                                                                                                                                                                                                                                                               Immunostimulatory CpG oligonucleotide WD1004 for use in an HIV vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coll and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allersy or minmune deficiency. The present sequence can also be used to redirect a

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpseviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence Sequence Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

COTHER INFORMATION: synthetic oligonucleotide
NAME/KEY: misc_feature
LCCATION: (0)...(0)
COTHER INFORMATION: Has a phosphorothicate backbone.
US-09-082-649B-52
